

STDs Talk. Test. Treat.

There are approximately 19 million new cases of sexually transmitted diseases (STDs) in the U.S. each year, almost half of them among young people ages 15 to 24. Many of those who are infected don't know it because several STDs do not have any symptoms.

Although many STDs are easily treated and cured, most doctors do not automatically test for chlamydia or other STDs during a yearly checkup, routine pelvic exam, or Pap test. Most males who get an STD never develop any symptoms or health problems. It is important for males and females to talk, test and treat.

- Talk.** Talk to your partner and your health care provider.
- Test.** Make an appointment for STD testing.
- Treat.** Treat the disease and avoid additional health problems.

The Most Common STDs:

- Human Papillomavirus (HPV or genital warts)
- Herpes Simplex Virus (genital herpes)
- Chlamydia
- Gonorrhea
- Trichomoniasis
- Syphilis
- HIV
